Project Contribution Breakdown:

Wasi Ur Rehman:

- **Full-Stack User Management:** Created the login and registration system. Built the user interface and wrote the PHP logic to handle user authentication, making sure admins and assessors have the correct permissions.
- **Back-End Result Viewing:** Handled the server-side code for viewing grades. Wrote the database queries to correctly pull, filter, and send the students' assessment data to the front-end pages.
- **Database Implementation:** Built the actual MySQL database and wrote the database.sql script. Set up all the tables, applied the primary and foreign keys to link everything together, and populated it with the sample dummy data for testing.

Huda Amin:

- **Full-Stack Internship Management:** Built the section where admins manage student records. Designed the pages and wrote the back-end code to assign students to specific assessors and save their company details.
- **Front-End Result Viewing:** Designed the user interface for viewing the final grades. Set up the data tables and search features so the assessment results are clear and easy to read.
- **System Design (ER Diagram):** Created the visual blueprint for the database. Drew the final Entity-Relationship Diagram (COMP1044_ERD.pdf) using crow's foot notation to map out exactly how all the entities and tables connect to each other.

Kamila Mahenti:

- **Full-Stack Internship Result Entry and Mark Calculation:** Handled the main grading system. Built the evaluation forms that the assessors fill out, and wrote the back-end PHP math logic that takes those inputs and automatically calculates the final percentages based on the exact faculty weightages.
- **System Demonstration (Video):** Planned and recorded the final 5-minute video presentation (video.mp4). Walked through the system to demonstrate all the features working together and showed the final results successfully updating in the database.
